Profile

MSc Computer Science student (Computer Systems and Infrastructure track) at VU Amsterdam, with 1+ years as a data analyst/engineer at Sopra Steria, building SQL pipelines, data models and BI dashboards on datasets of millions of rows. Looking for a software, systems or data engineering internship, full-time from January 2027 for 3–6 months.

Education

Vrije Universiteit Amsterdam & University of Amsterdam Sep 2026 – Expected Jul 2028
MSc Computer Science (joint degree), track Computer Systems and Infrastructure *Amsterdam, NL*

- Courses: Programming Large-Scale Parallel Systems (Julia), Performance of Networked Systems; from 2027: Distributed Algorithms, Web Services and Cloud-Based Systems, Accelerator-Centric Computing Ecosystems.

Sapienza University of Rome Sep 2022 – Oct 2025
BSc Computer Science (Informatica) – final grade 102/110 *Rome, IT*

- Thesis: conceptual modelling for data warehousing, based on my internship at Sopra Steria.
- Erasmus+ exchange semester at Universidad Carlos III de Madrid (Sep 2024 – Jan 2025).

Experience

Sopra Steria Italia Mar 2025 – Aug 2026
Data Engineer (intern, then apprentice) *Rome, IT*

Energy sector (Dremio data lake, SQL, Power BI)

- Built and maintained 3 Power BI dashboards end to end, writing the transformations as layers of **SQL views in Dremio** over tables of **tens of millions of rows** and feeding Power BI datasets of **5M+ rows** each:
  - grid reliability in **6 countries** (IT, ES, AR, BR, CL, CO): outages and faults via SAIDI, SAIFI, CAIDI;
  - logistics: stock, turnover and consumption, price/volume/FX effects, local-currency-to-EUR conversion;
  - installed grid materials.
- Validated the data reaching Dremio and our transformations **against the source SAP tables**.
- Maintained 2 more dashboards (contracts, network topology), fixing and extending them based on user feedback.
- Early adopter in the team of AI-assisted development with MCP servers and of the PBIP format for Git-versioned Power BI reports.

Public administration

- **Designed and implemented a new Oracle database** for a national government agency to manage the reuse and transfer of its technology assets: turned loosely defined functional requirements into the conceptual and physical models and the implementation. Once live, it should serve up to **tens of thousands of external users** plus agency staff.
- Maintained the dimensional-model repository of a data warehouse: updated existing star schemas and added new ones.
- Wrote **Python scripts** that parse SAP BusinessObjects universe exports and match objects across universes to find overlaps and universes to merge or optimise; **replaced hours of manual review**.
- Designed from scratch the **star schemas** behind 2 Qlik Sense dashboards on tax-court data (up to 100K+ rows).
- Built the first module of a Python generator for data-warehouse change-specification documents, saving several hours per document.

Projects

- **MyTransferApp** (C, Linux) – client/server file transfer over sockets, using multiprocessing and multithreading.
- **MyFinger** (C, Linux) – re-implementation of Unix `finger`, reading user data from Linux system files.
- **MyBank** (Python, PostgreSQL) – app protecting user data with symmetric/asymmetric encryption and signatures.
- **JBomberman** (Java) – Bomberman clone built on OOP and design patterns.

Skills & Other

Programming	Python, SQL, C, Java, Julia
Data & BI	Dimensional modelling, Oracle, PostgreSQL, Dremio, Power BI (DAX), Qlik Sense, SAP BO
Systems & tools	Linux, Git, sockets and concurrency in C, parallel programming
Languages	Italian (native), English (C1, IELTS 7.5), Spanish (B1)
Part-time jobs	Orientation desk at Sapienza (Feb–Aug 2024); Infopoint employee, PTA Group (May–Aug 2024); waiter, La Masseria, Rome (Jun 2021 – Apr 2024), alongside my studies
